Web Design and Development I

Mohammad Zafar Shafaq

Introduction

Mohammad Zafar Shafaq

MASTER OF COMPUTER SCIENCE

INFO:

- Lecturer: Mohammad Zafar Shafaq
- Email: zafarshafaq34@gmail.com

GRADING

- Midterm: 20%
- Final: 60%
- Programming Projects/Assignments: 10%
- Homework and practice: 10%

REQUIRED TO HAVE KNOWLEDGE

- Object Oriented Programming

TEXT BOOK

HTML & CSS Design and build Websites by Jon Duckett
Publisher : John Wiley & Sons, Inc. 10475 Crosspoint
Boulevard Indianapolis, IN 46256
Language : English
Paperback : 688 pages
ISBN: 978-1-118-00818-8

PHP 7 Programming Cookbook Kindle Edition
ISBN-13: 978-1785883446
ISBN-10: 1785883445

PHP for the Web: Visual QuickStart Guide 5th Edition

FOCUS OF THE COURSE

- This is a PROJECT based course.
- Web Design and Development using HTML, CSS and JavaScript
 - problem solving, and designing solutions
 - Website and web Application design, implementation, and testing
 - Basic concepts
 - WWW
 - HTTP, HTTPS
 - Front End
 - HTML, CSS, JavaScript

Agenda

- Course Overview
- Required Editors
- Introduction about Web

WHAT IS WWW

World Wide Web the total set of interlinked hypertext documents residing on internet servers all around the world.

Documents on the World Wide Web, called pages or Web pages, are written in HTML (Hyper Text Markup Language), identified by URLs.

The World Wide Web was developed by Timothy Berners-Lee in 1990's for the European Laboratory for Particle Physics.

WEB PAGE

A document on the World Wide Web. A Web page consists of an HTML file, with associated files for graphics and scripts, in a particular directory on a particular machine (and thus identifiable by a URL).

WEB SITE

A group of related webpages and associated files, scripts, and databases that is served up by an internet server on the World Wide Web.

The webpage in a Web site generally cover one or more related topics and are interconnected through hyperlinks.

Most Web sites have a home page as their starting point, which frequently functions as a table of contents for the site.

WEB BROWSER

A software which is used to view webpages and access files and software related to those webpages.

Originally developed to allow users to view or browse documents on the World Wide Web.

Most Web browsers are also capable of downloading and transferring files. e.g. Internet Explorer, Google Chrome, Mozilla Firefox etc.

WHAT IS WEB SERVER

A Web Server is special software, which runs on a computer and responds to requests made by other computers on the network.

The web server satisfies the requests of the client (Web Browser).

It usually has access to a resource, such as data, that the client wants.

- When the resource that the client wants becomes available, it sends a message to the client.
- 

CLIENT VS SERVER SIDE

Website scripts run in one of two places :

the client side, also called the front-end.

the server side, also called the back-end.

The client of a website refers to the web browser that is viewing it.

The server of a website is, of course, the server that hosts it.

Most web coding languages are designed to run on either the server side or the client side.

CLIENT SIDE LANGUAGES

- 
- HTML
 - CSS
 - JavaScript
 - VBScript
 - Etc.
- 
- 

SERVER SIDE LANGUAGES

- PHP
 - C#
 - Python
 - etc.
- 
- 

WHICH PROTOCOL IS USED BY WEB APPLICATION?

- HTTP
 - HTTPS
- 
- 

WHAT ARE THE TYPES OF WEBSITE?

- Static Website
 - Dynamic Website
- 
- 

STATIC WEBSITE

- Static website is the basic type of website that is easy to create.
- You don't need the knowledge of web programming and database design to create a static website.
- Its web pages are coded in HTML.
- The codes are fixed for each page so the information contained in the page does not change and it looks like a printed page.

Server

Client/Browser

Static Website

DYNAMIC WEBSITE

- Dynamic website is a collection of dynamic web pages whose content changes dynamically.
- It accesses content from a database.
- When you alter or update the content of the database, the content of the website is also altered or updated.
- Dynamic website uses client-side and server-side scripting, to generate dynamic content.
- Client side scripting generates content at the client computer on the basis of user input.
- The web browser downloads the web page from the server and processes the code within the page to render information to the user.

DYNAMIC WEBSITE CONT....

Dynamic Website

STATIC VS DYNAMIC WEBSITE

Static Website	Dynamic Website
Prebuilt content is same every time the page is loaded.	Content is generated quickly and changes regularly.
It uses the HTML code for developing a website.	It uses the server side languages such as PHP, SERVLET, JSP, and ASP.NET etc. for developing a website.
It sends exactly the same response for every request.	It may generate different HTML for each of the request.
The content is only changed when someone publishes and updates the file (sends it to the web server).	The page contains "server-side" code which allows the server to generate the unique content when the page is loaded.
Flexibility is the main advantage of static website.	Content Management System (CMS) is the main advantage of dynamic website.

WEB HOSTING

Web hosting is a service that allows users to post web pages to the server.

Web hosting companies provide customers with a variety of services related to building and maintaining websites.

Types of Web Hosting

- 
1. Dedicated Hosting
 2. Shared Hosting
 3. Free Hosting
 4. Cloud Hosting
