Agenda

• HTML Basics

• Tags

• Page Structure

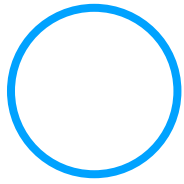

LINKS

Links are the defining feature of the web because they allow you to move from one web page to another.

Types of Links:

- Links from one website to another
 - Links from one page to another on the same website
 - Links from one part of a web page to another part of the same page
 - Links that open in a new browser window
 - Links that start up your email program and address a new email to someone
- 
- 

WHAT IS URL?

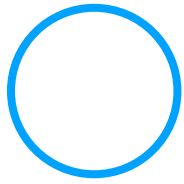

URL stands for Uniform Resource Locator.

Absolute URL.

When you link to a different website, the value of the **href** attribute will be the full web address for the site, which is known as an **absolute** URL.

Relative URLs

When linking to other pages within the same site, you can use relative URLs.

CREATING A LINK

Links are created using the `<a>` element. Users can click on anything between the opening `<a>` tag and the closing `</a>` tag. You specify which page you want to link to using the **href** attribute.

The diagram illustrates the components of an HTML link tag: `<a href="http://www.imdb.com">IMDB</a>`. Brackets and labels identify each part: the opening tag `<a href="http://www.imdb.com">` is labeled "OPENING LINK TAG"; the URL `http://www.imdb.com` is labeled "THIS IS THE PAGE THE LINK TAKES YOU TO"; the text `IMDB` is labeled "THIS IS THE TEXT THE USER CLICKS ON"; and the closing tag `</a>` is labeled "CLOSING LINK TAG".

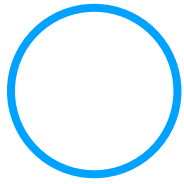

```
<a href="http://www.imdb.com">IMDB</a>
```

LINKING TO OTHER SITES

`<a href="http://www.ku.edu.af">`Kabul
University**`</a>`**

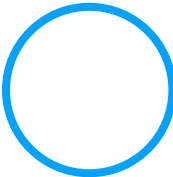

LINKING TO OTHER PAGES ON THE SAME SITE

Same Fold **`<a href="about-us.html">`** About**`</a>`**

Child Folder **`<a href="School/Index.html">`** Home**`</a>`**

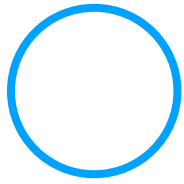

Parent Folder **`<a href=" ../contact.html">`** Contact**`</a>`**

LINK TO WEBSITE AND PAGES

DEMO-1

LINKING TO A SPECIFIC PART OF THE SAME PAGE

TO link different part of the same page we are using id attributes

```
<h1 id="top"> This is the Top of the page</h1>
```

```
<a href="#bottom">bottom</a>
```

```
<br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br>
```

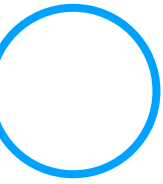

```
<br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br>
```

```
<br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br>
```

```
<br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br><br>
```

```
<a href="#top"> top</a>
```

```
<h1 id="bottom"> this is the bottom of the page</p>
```

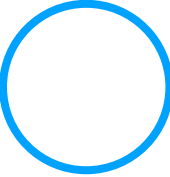

EMAIL LINKS

`<a href="mailto:jon@example.org">Email Jon</a>`

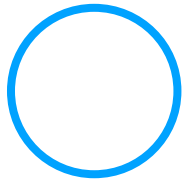

OPENING LINKS IN A NEW WINDOW

Target

```
<a href="about-us.html" target="_blank">About-Us</a>
```

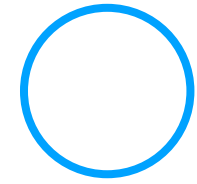

LINK TO THE PARTS OF THE PAGE, EMAIL, AND
TARGET ATTRIBUTES

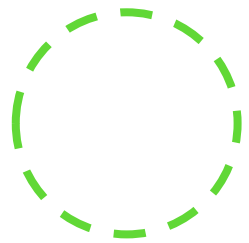

DEMO-2

IMAGES ON THE PAGE

To add an image into the page you need to use an **** element.

src

This will usually be a relative URL pointing to an image on your own site.

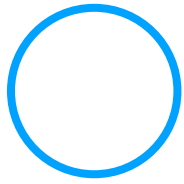

alt

This provides a text description of the image if you cannot see it.

title

It will display additional information about the image if user hover the mouse over the image.

ADDING IMAGE

ALIGNING IMAGES HORIZONTALLY

Align attributes

Left

right

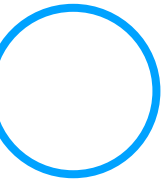

FIGURE AND FIGURE-CAPTION

Figure and Figure-Caption are included in HTML 5 to add.

```
<figure>
```

```

```

```
<br />
```

```
<figcaption>this image belong to Kardan  
university.</figcaption>
```

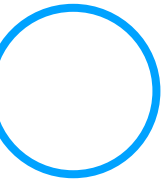

```
</figure>
```

IMAGE

DEMO-3

SUMMARY LINK

Links are created using the **<a>** element.

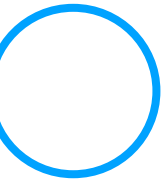

The **<a>** element uses the **href** attribute to indicate the page you are linking to.

If you are linking to a page within your own site, it is best to use relative links rather than qualified URLs.

You can create links to open email programs with an email address in the "to" field.

You can use the **id** attribute to target elements within a page that can be linked to.

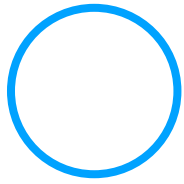

SUMMARY IMAGE

The **** element is used to add images to a web page.

You must always specify a **src** attribute to indicate the source of an image and an **alt** attribute to describe the content of an image.

You should save images at the size you will be using them on the web page and in the appropriate format.
